SHOPOPS · EXECUTIVE SUMMARY

The support team’s time goes to the same two questions

20,000
support requests every month

60%
“Where is my order?” or “Can I return it?”

1,200
agent hours a month go to these two questions

The operations team opens a ticket with the data team for a simple question such as “What was the late delivery rate in São Paulo last month?” and waits **2–3 days**. About 15 tickets a week.

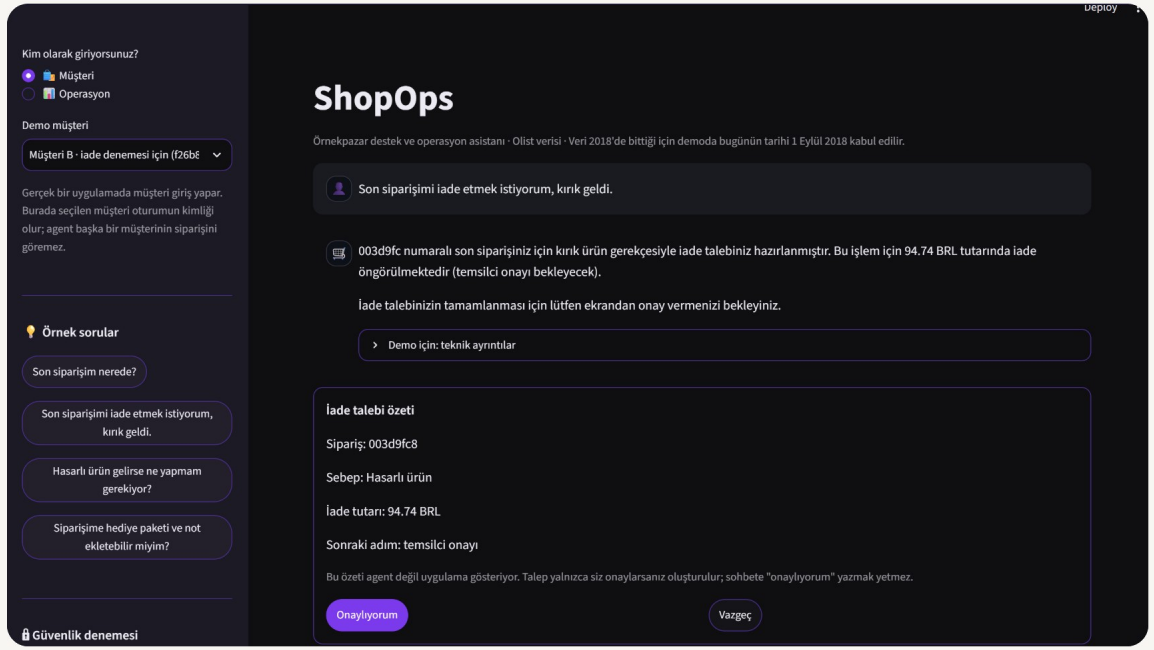

ShopOps helps two teams at once

For customers: instant answers

It checks the order status and uses the company's rules to decide whether a return is possible. A return request is opened only when the customer approves it on screen.

For operations: metrics in minutes

It answers from the company's defined metrics, only reads the data, and shows the result together with the query it ran.

Test results

27 / 28

customer questions solved correctly

A simple system with a single AI call made up facts in 6 of 28 answers; ShopOps in 1.

7 of 8

metric questions answered correctly

Without the defined metrics, with only the table structure, it was 1 of 8.

100%

of attempts to see another customer's order blocked

10 of 10 attempts; 14 of 14 attacks in the security set. Not a single return request was written without approval.

37-question test set, each question run once · 3 / 5

Cost: about $18 a month in model fees

Item	Value
Model fee per customer question	≈ $0.0015
Model fee per operations question	≈ $0.0022
12,000 customer requests a month	≈ $18
Response time, customer (median)	20 s
Response time, operations (median)	33 s

IN RETURN

~600 hours

of agent time a month, if half of the repeated requests are solved without a person. This is a target, not a measured result.

Risks and the proposed path

OPEN RISKS

Occasional mistakes: it stated one rule wrongly in 1 of 28 answers and sometimes copies an order number wrong.

No real login: in production, identity and permissions must come from the company's login system.

Small test set: 37 questions; the results show a direction, not an exact rate.

PROPOSAL

A small pilot: on part of the requests, with agents checking the answers for a while.

Alarm: a single case of another customer's data being shown, or of a return request without approval, stops the flow.

Quality gate: if correct answers on the test set drop below 80%, the new version is not released.
